High pressure tank cleaner:

This tank cleaner must be driven by a high pressure pump via standard connection and high pressure valve. It can either be connected to an existing high pressure system or connected to a separate high pressure system installed for this specific purpose. Whether existing or a new system, it must be a pressure controlled system. The high pressure tank cleaner is supplied with a number of nozzles with different sizes in order to obtain the flow and pressure to suit the high pressure system. It is recommended to execute cleaning at least once daily, this can be done automatically via the DM6000 feed computer.

The equipment may not be installed or used before all safety precautions on mixing tank and electrical panels (Standard of SKIOLD) is installed and enabled. High pressure hose and couplings are NOT in the packages.

Technical information:

- High pressure inlet: AR1 A M22
- Electric connection: 220 Vac for cleaner and valve
- Rated pressure: 220 bar - 22 MPa
- Permissible pressure: 250 bar - 25 MPa
- Rated flow rate: 21 L/min.
- Rated temperature: 90° C
- Electric motor: 12 V DC - 12W (converter for 220 Vac)
- Cable length: 10 m
- Min. overall ø: 40 mm
- Nozzle type: 2 x M4
